## WHAT IS ERECTILE DYSFUNCTION (ED) OR IMPOTENCE?

Erectile dysfunction (ED) occurs when a man has consistent and repeated problems sustaining an erection. Without treatment, ED can make sexual intercourse difficult.

It is a condition with profound psychological consequences and may interfere with a man's overall well-being, self-esteem and inter-personal relationships. ED is a common problem affecting all age groups but becomes more common with increasing age. ED usually has something physical behind it, particularly in older men. Generally there is impairment of blood-flow or poor nerve conduction. **But this does not mean growing older is the end of your sex life. ED can be treated at any stage.**

ED can be caused by chronic diseases (Diabetes, Cardiovascular Disease, Kidney Disease, etc.), Lifestyle Choices (Smoking, Excessive Drinking, Drug Abuse, etc.) or Psychological Factors (Stress, Depression, Poor Self Esteem, Performance Anxiety).

It can have significant impact on the quality of life of sufferers, partners and families. Talking openly to your partner about ED will help her understand the diagnosis and treatment options. This will reassure her that you haven't lost interest.

▶ About 40% of men experience some degree of ED by age 40

▶ About 70% of men experience some degree of ED by age 70

▶ The percentage of complete ED increases from 5% to 15% as age increases from 40 to 70 years

▶ Nearly one out of every two men with diabetes experience ED

## THE TREATMENT - LINEAR SHOCKWAVE THERAPY (LSWT)

LSWT is a scientifically proven solution for ED which improves blood flow in the penis and cures erectile dysfunction, thus enabling the patient to achieve and maintain dependable erection. Its main advantage is the ability to permanently improve and potentially cure erectile dysfunction / impotence.

## WHATS WRONG WITH THE EXISTING ONES?

Existing options such as pills, injections and vacuum devices help in overriding immediate erection issues temporarily but don't actually address the underlying problem. All work by improving blood flow to the penis during arousal.

Primary cause of ED is narrowing of the arteries that take blood to the penis. This new treatment (LSWT) restores the blood-flow mechanism so that natural and spontaneous erections are achievable in men who suffer from vascular problems. Unlike current short-term treatments used for erectile dysfunction, this revolutionary new approach works in the longer term.

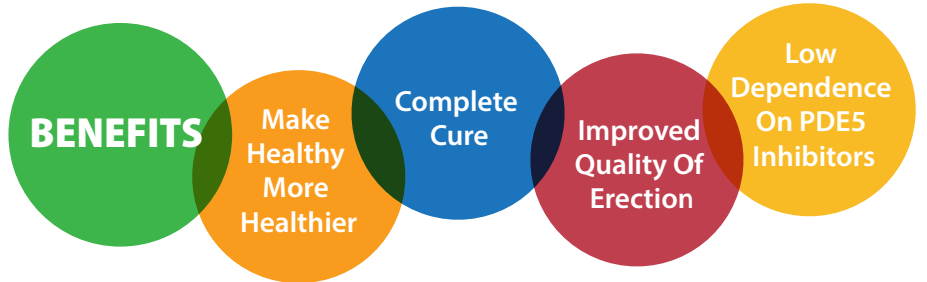

### Linear Shockwave Therapy is a cure for ED and not temporary relief

-  NO SIDE EFFECTS
-  NO BOOSTER PILLS
-  NO PAIN
-  NO ANAESTHESIA
-  NO HOSPITALISATION
-  NO INJECTIONS

LSWT does not involve use of any medication and has no side-effect or stress to other organs or healthy tissue. It is a non-invasive painless procedure and requires no sedation or anaesthesia. The treatment is well-researched and is painless with a noticeable improvement in erections after a few sessions with promising results.

**It is one of the things that sound too good to be true, but research indicates that this treatment possesses unprecedented qualities that can restore erectile tissue.**

## HOW DOES LSWT WORK?

It is specifically designed for the treatment of erectile dysfunction and involves low-density shockwaves (similar to ultrasound waves). The shockwaves created are focused onto the treatment area stimulating the treated tissues to grow new blood vessels.

During this procedure, shock-wave treatment is administered in an outpatient setting – in short spurts – often lasting about 20 minutes at a time. The treatment isn't painful, so no sedation is required and men can return to their normal activities immediately following the procedure.
